

Q1 - This is a TED talk: Don't Fear Intelligent Machines. Work With Them.

Kasparov himself comments that "**Machines have calculations. We have an understanding.**"

Is Deep Blue intelligent? Yes, in a narrow, domain-specific sense; No, if we mean general human-like intelligence.

What made it successful? Huge compute + human expert knowledge + preparation + tuning + match-format advantage.

Who gets credit? The human engineers and chess experts behind the machine — not just the machine itself.

Q2 –

2.1 What implications do you think such digital assistants will have for people?

They save time by handling routine phone calls, make life more convenient, and help people who struggle with calls, but they also raise privacy and transparency concerns.

2.2 What opportunities it might open for businesses?

They save time by handling routine phone calls, make life more convenient, and help people who struggle with calls, but they also raise privacy and transparency concerns.

2.3 Is Google Duplex narrow, general or super AI? Explain.

It is narrow AI because it is designed to perform one specific task, making phone calls and handling simple conversations, not broad human-level reasoning.

2.4 What impressed you most in this demo?

The natural, human-like speaking style, including pauses, "uh-huh," and smooth conversation handling, made the AI sound realistic and capable in a real phone call.

Q3 –

3.1 What the author has to say about the importance of the Turing test?

The author says the Turing Test is important because it gives us a practical way to check if a machine can act like a human in conversation. Instead of asking “Can machines think?”, Turing showed that we can judge intelligence by how well a machine imitates human behaviour.

3.2 How Turing test is conducted?

The test is done by having a human judge chat through text with a human and a machine without seeing them. If the judge can't tell which one is the machine, then the machine is considered to have passed the test.

3.3 What Turing predicted would happen by 2000? Did it happen in your opinion?

Turing predicted that by the year 2000, machines would fool people about 30% of the time in a short conversation. This happened partly in competitions, but in real everyday conversation, machines still weren't as convincing as humans. So it was true only in limited situations.

3.4 What parts of Mitsuku's 2016 transcript resemble human conversation the most?

The most human parts were when Mitsuku used friendly small-talk, made jokes, responded naturally, and asked follow-up questions. These made the conversation feel more like a real person was talking.

3.5 Who was Eugene Goostman?

Eugene Goostman was a chatbot designed to sound like a 13-year-old boy. It became famous for fooling some judges in a Turing Test, leading them to believe it was a real human.
